

FLEA FACTS

A Female Flea
Can Lay About

50
eggs per day

and up to

2000
eggs in a lifetime

The average adult flea
life span lasts up to
2 Months

In just 30 days, 25 adult females can multiply into

250,000 fleas

Why killing flea eggs and larvae is essential

Flea eggs and larvae are the first 2 of 4 stages in the flea life cycle. If these two stages are not terminated then larvae will spin silk cocoons and enter the pupal stage.

There are three physical cues that allow a pupa to turn into an adult flea:

- Vibration
- Pressure
- Carbon Dioxide

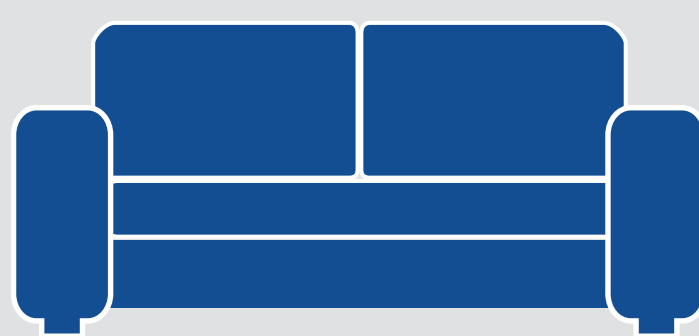

Basically, cues let a pupa know that its a good time to become an adult, because a host (dog, cat, you) are in the area.

Products such as Hartz Ultraguard Pro Flea & Tick Drops for Dogs and Puppies not only kill adult fleas but also the eggs and larvae, preventing future infestations.

The eggs are laid in the pet's coat and drop off the pet almost anywhere it may roam, especially where your pet sleeps:

rugs and carpets

upholstered furniture

cat boxes

kennels
